Style Guide

Prose

- Prefer title case for chapter/section headings, ex: `## Generating a Secret
  Number` rather than `## Generating a secret number`.
- Prefer italics over single quotes when calling out a term, ex: `is an
  associated function of` rather than `is an 'associated function' of`.
- When talking about a method in prose, DO NOT include the parentheses, ex:
  `read_line` rather than `read_line()`.
- Hard wrap at 80 chars
- Prefer not mixing code and not-code in one word, ex: ``Remember when we wrote
  `use std::io`?`` rather than ``Remember when we `use`d `std::io`?``

Code

- Add the file name before markdown blocks to make it clear which file we're
  talking about, when applicable.
- When making changes to code, make it clear which parts of the code changed
  and which stayed the same... not sure how to do this yet
- Split up long lines as appropriate to keep them under 80 chars if possible
- Use `bash` syntax highlighting for command line output code blocks

Links

Once all the scripts are done:

- If a link shouldn't be printed, mark it to be ignored

  - This includes all "Chapter XX" intra-book links, which _should_ be links

    for the HTML version

- Make intra-book links and stdlib API doc links relative so they work whether

  the book is read offline or on docs.rust-lang.org

- Use markdown links and keep in mind that they will be changed into `text at

  url` in print, so word them in a way that it reads well in that format
